Yinon Mitin

Site Reliability Engineer | Kubernetes | AWS | Terraform | Observability | Linux | Networking

yinon.mitin@gmail.com | linkedin.com/in/yinon-mitin | Location: Tel-Aviv, IL

Summary

Platform and **Site Reliability Engineer** focused on **production infrastructure**, Linux, Kubernetes, cloud platforms, networking, **automation**, and observability. Builds and maintains **CI/CD pipelines**, **Terraform** and **Helm** infrastructure workflows, **monitoring** and **alerting systems**, secure access controls, backup/recovery procedures, and operational automation for business-critical environments. Combines commercial e-commerce infrastructure experience with ownership of distributed connectivity systems, applying SRE, DevSecOps, and platform engineering practices across reliability, **scalability**, security, and runtime operations.

Professional Experience

DevOps Engineer | Padani Jewelers - E-commerce | 2020-2024

- Led automation for a large-scale **Magento-to-Shopify migration**, designing repeatable data flows, batch processing routines, validation steps, and operational handoff processes that **reduced large catalog deployment time by approx. 60%**.
- Developed and maintained a **production-facing Python ETL pipeline** for extracting, validating, normalizing, transforming, and reconciling product data across business-critical systems.
- Built automated asset collection workflows from vendor and brand sources, applying SKU-level naming **standards**, packaging **rules**, integrity **checks**, and structured delivery into downstream systems.
- Operated **recurring production workloads on Linux** using cron, SQLite state tracking, structured logs, retry-safe routines, and automated dataset generation to reduce manual intervention and improve reliability.
- Built a microservices platform with **AWS-based infrastructure** provisioned via **Terraform**, workloads deployed to managed **Kubernetes**, and application releases managed with **Helm**.
- Implemented **GitLab CI/CD pipelines** to automate builds, validation, deployment flow, and operational repeatability across infrastructure and application changes.
- Added **Prometheus**, **Grafana**, and **alerting** visibility to improve runtime monitoring, release confidence, and service reliability.
- Improved operational troubleshooting by standardizing logs, dashboards, **failure detection** points, and repeatable recovery procedures for automation and infrastructure workloads.

Infrastructure Engineer & SRE | Portal VPN LLC | 2024-Present

- Designed and built a **commercial VPN/connectivity platform** from scratch for **thousands of users**, high traffic throughput, **distributed ingress/egress** points, **load-balanced routing**, autoscaling, and **24/7 operation**.
- Defined the full topology with **isolated Linux nodes** for protocol termination, traffic routing, control-plane services, observability, log aggregation, backups, and administrative access.
- Implemented multi-protocol support across **WireGuard, OpenVPN, VLESS, Xray-based stacks**, and related tunneling technologies to serve heterogeneous clients, routing constraints, censorship-resistance scenarios, and protocol redundancy.
- Built resilient traffic paths using **load balancers**, reverse proxies, **firewall** boundaries, **DNS** controls, secure management channels, and service isolation to enforce **defense-in-depth** across production nodes.
- Implemented **metrics, structured logs, uptime checks, dashboards, and alerting**; telemetry is transported through encrypted tunnels instead of exposed public management endpoints.
- Built a **Telegram-based commercial and administrative control plane** for onboarding, subscription payments, access provisioning, operational notifications, and customer-facing automation.
- Designed a dedicated data-protection layer with separate log and backup nodes, **encrypted backup workflows**, external replicas, recovery procedures, and failure-isolation boundaries.
- Applied **DevSecOps/SRE practices** across access control, SSH hardening, firewall policy, secrets hygiene, patching, health checks, incident feedback, capacity planning, and repeatable recovery.
- Owns the platform end-to-end as a **commercial infrastructure product**, with uptime, security posture, customer impact, cost efficiency, automation quality, and reliability treated as core engineering requirements.

Independent Infrastructure & Platform Projects

HomeLab / Private Infrastructure Platform

- Built and currently operates an **enterprise-grade private infrastructure** environment with **multiple routers, managed switches, servers**, segmented networks, self-hosted services, **private DNS**, **firewall policy**, and controlled remote access.
- Designed **VLAN segmentation**, routing boundaries, DNS filtering, secure tunnels, and isolated service zones to enforce segmentation, containment, and **least-privilege access boundaries**.
- Operates self-hosted services for **backup orchestration**, storage management, media automation, monitoring, alerting, and lifecycle maintenance without unnecessary public exposure.
- Built resilient storage workflows with **mirrored NAS**, **scheduled replication**, external backups, validation routines, and **recovery testing** to reduce data-loss risk.
- Runs **containerized Linux** services with service discovery, reverse proxying, health checks, log collection, update routines, and maintenance automation.
- Operates the environment as a long-running private infrastructure platform for validating network architecture, service automation, observability, recovery workflows, security controls, and capacity planning under real operational constraints.

Skills

SRE / Platform Engineering: Production Ownership, Reliability Engineering, Incident Response, Troubleshooting, Runtime Analysis, Capacity Planning, Operational Automation, Backup & Recovery, Hardening, RCA
Infrastructure / Cloud: Linux, AWS, EC2, S3, RDS Concepts, VPS/VDS Infrastructure, Terraform, Docker, Kubernetes, Helm, Git, GitLab CI/CD, Infrastructure as Code
Networking / Security: TCP/IP, DNS, Firewall Policy, VLANs, Routing, Reverse Proxy, HAProxy, Nginx, Load Balancing, WireGuard, OpenVPN, VLESS, Xray-based Protocols, Secure Tunnels, Access Control
Observability: Prometheus, Grafana, Loki, Alertmanager, Metrics, Dashboards, Structured Logging, Uptime Monitoring, Telegram Alerts, OpenTelemetry, ELK Stack
Automation / Programming: Python, Bash, Cron, SQLite, ETL Automation, Deployment Automation, Validation Pipelines, Operational Runbooks, AI-assisted Debugging with Cursor / Claude Code
Cloud Exposure: AWS, GCP, Yandex Cloud

Education

Computer Science | LIT | 2017-2020
Software Engineering | Yandex University | 2017-2022
