

Yinon Mitin

Infrastructure Automation Engineer · Linux · Cloud · Networking · Reliability

Israel · yinon.mitin@gmail.com · [GitHub](#) · [LinkedIn](#)

Summary

Infrastructure Automation Engineer focused on Linux platforms, networking and reliable, repeatable operations. Brings four years of experience supporting retail IT and e-commerce systems, including an independently delivered Python automation project, alongside substantial infrastructure and platform work. Architected role-separated VPN infrastructure, automated complete cloud application lifecycles and built reproducible self-hosted systems with private networking, observability and validated recovery. Approaches infrastructure as an engineered product, emphasizing clear service boundaries, security, maintainability and minimal manual intervention. Seeking a remote Infrastructure Automation or Platform Engineering role within a collaborative team, with ownership of meaningful technical problems and room to improve how systems are built and operated.

Professional Experience

Padani Jewelers - E-commerce Systems & Automation Specialist | 2022-2026

- **Retail IT operations and troubleshooting:** Configured and supported workstations, user access, POS systems, peripherals and network connectivity across retail locations.
- **Python workflow automation:** Automated repetitive e-commerce data, file and image-processing workflows.
- **Magento-to-Shopify migration of up to 1,000 SKUs:** Independently built Python pipelines for parsing, cleaning, transforming and validating catalog data, replacing repetitive manual preparation with batch processing.
- **Validated Shopify import packages:** Standardized inconsistent descriptions, attributes and capitalization while correctly mapping sections, processing an average of 4-7 product images per SKU and reporting actionable errors.

Selected Infrastructure & Platform Projects

Phoenix - Commercial VPN Platform | 2026-present

- **Commercial VPN platform ownership:** Co-founder and technical owner of infrastructure designed to provide reliable access in restrictive and heavily filtered network environments.
- **Automated infrastructure provisioning:** Built a four-node foundation with distinct management, panel, observability and public-facing roles; tested core provisioning on clean VPS instances and designed a separate exit-node layer for expansion.
- **Secure network segmentation:** Separated administrative, management and observability traffic across private WireGuard networks, applying least-privilege connectivity and exit-node isolation.
- **Customer-facing VPN architecture:** Designed the service and control layer around Remnawave, Xray Core and VLESS, separating subscriber traffic from the platform's internal network.
- **Subscription platform design:** Defined the intended purchase-to-access workflow for web and Telegram channels, including payments, time-based plans and access-link delivery.

Status Page - Automated Cloud Application Platform | 2026

[Project repository](#)

- **End-to-end cloud platform delivery:** Automated infrastructure provisioning, network configuration, application deployment, observability, backup and recovery for a web application.
- **Validated lifecycle and recovery:** Automated provisioning, release and teardown; verified backup integrity through successful restoration and post-recovery application checks.
- **Infrastructure as code and CI/CD:** Implemented the platform with Terraform, AWS ECS Fargate, RDS, ElastiCache, ECR, GitHub Actions with OIDC and CloudWatch.

Phanes - Reproducible Self-hosted Media Platform | 2024-present

[Project repository](#)

- **Reproducible self-hosted platform:** Productized a personal media environment by automating deployment and integration of Jellyfin and its supporting services.
- **Private-by-default networking and recovery:** Combined segmented least-privilege networks and Tailscale with automated encrypted Restic backups and validated recovery workflows.
- **Infrastructure codified for rebuilds:** Defined service topology, container networking, permissions and configuration as a reproducible Debian environment.

Additional Projects

ForgeFF - Native macOS Media Tool

[Project repository](#)

- **Native preset-first media automation:** Built a macOS application that turns FFmpeg into an accessible batch workflow while retaining direct command control for advanced users.

Flight Above Head - ESP32 Ambient Display

[Project repository](#)

- **Always-on ESP32 product:** Designed an ambient display combining live overhead-flight information and emergency alerts with decorative modes that adapt to the environment and time of day.
- **Embedded software development:** Built the firmware, API integrations and rendering system for a physical device in continuous use.

Education

DevOps Bootcamp - Nitzanim, Atid | 2026

- Hands-on DevOps training in Linux, networking, cloud infrastructure and containers, with Terraform, Ansible, Docker, GitHub Actions and AWS.
- Applied infrastructure as code, configuration management, CI/CD, observability and backup/recovery practices.

Skills

Core: Linux, macOS, Python, Bash, Git

Infrastructure automation: Ansible, Terraform, Semaphore UI, GitHub Actions, CI/CD

Networking and security: TCP/IP, DNS, SSH, firewalls, network segmentation, Nginx, Caddy, Cloudflare

VPN and private networking: WireGuard, OpenVPN, Netmaker, Tailscale, Amnezia VPN, Outline, Xray Core, Remnawave, Hiddify

Containers and cloud: Docker, AWS (ECS/Fargate, ECR, RDS, ElastiCache)

Observability and reliability: Prometheus, Grafana, Loki, CloudWatch, Restic, backup and recovery

Languages

English - C1 | Russian - Native | Hebrew - A2
